

Imagine you are me and you are to generate a blueprint. This is something that I have experience and I know. So my project is about poultry farming. I want my interface to have today's date. I want the site to have, like, we are accountable of something. I hope you'll get this letter as we continue. And I want this to be, like, maybe, so today I have a live count. Maybe the business started today, so, like, we are doing a live count. I don't know if you can generate something like an app so that, like, I can see under, in that app, I don't need to use data bundles or maybe Wi-Fi. Or maybe you generate a HTML site that can store data there even so nothing doesn't

occur. So, and I can just drop this, like, together so that you can note it later. So for that interface, it must also have average weight, yeah, the feed type, then there is feed amount. So I want to buy a weighing scale so that I can monitor every amount I input there because as they grow, maybe the ratio changes and you have to auto-fill some things for me. Then there is dosage day, so we have been giving it some vaccines to make it grow faster. Within three months, they are ready for sale. So for dosage day, I want it to be scheduled like I have to be reminded. So for the scheduled day, that has to be customized, so I have to customize. So you have to note the section. So for something else like feed quantity, then there is sawdust to give the poultry some warmth when they are

on the room. This goes with electricity, so I have a hanging bulb there to give it some heat so that they can withstand the cold. And I also have maybe if you can fill a section for the stock, and for the stock, there must be two sections, maybe for the stock that has been eaten and the stock that has been sold, since we are some, I mean, we like eating chicken. And maybe if you can just maybe add something, it's not necessary, but maybe if I add stock and I replaced. So I'm going to read you something so that you can just... Think about it, and now I go here. I want this to be professional. I will integrate a place key later, and you have to know that it's necessary. Okay, let me continue. Because I have to use a free model, remember that I'm not going for

something paid, I mean, or what. Just figure out how I can overcome this and maybe have something real. And then, I want something like I can upload a feed or maybe I can just put there a custom message, like this is the transaction, the things I've bought, maybe sawdust, I can maybe add there the transport that costed me maybe to bring the feed, maybe the dosage price, or the maybe the veteran, or something like that. I mean, I want to track everything. And then, I also, yeah, I was continuing, and I mean that you have to be like the accountant. So this means that I can input some custom message in there. So maybe a veteran is around and maybe I can input there the stock of my poultry for the veteran. I mean, part of the labor. And manual dribbler, who

always keeps everything in check, gives the feed in there, gives some clean water, and maybe prepares and changes the sawdust. And also, maybe to add also another thing for the electricity, we are currently on the free plan because I'm at my homestead, so I'm getting free plan. And for the projects, we are chicken lovers, and it may count as a loss, but it still since we used to buy it, the average cost of hen was marked at 600, 700, and that's basically the amount I've been selling it. So even if you go further, maybe like discounting someone could be a problem because this is just a startup and we have to maybe leverage on that to get more income so that we can, like, increase stock and maybe the price. So initially, we tried this project because we had

seen it from somewhere, so like, we started with almost 102 chicks. So after that, they went on well because we often checked on them, but unfortunately, after some time, to... Two chicks died on different instances, but the remaining survived. So, we have this limit to this since the space is insufficient. So far, three months, a lot of stock has been sold and we have to replace it. Note that we are on the fourth month, so the remaining stock is almost about 12 chicks, 12 hens I mean, and we have to restock them very soon. So, I want something that goes with the idea of what I'm telling you. And maybe if you could, like, make something professional, since I am a statistics student and I am an IT guy, create a local cashier site or app, maybe

probably in my Chrome browser where my mother can access and easily manage the stocks and the operations that she is doing. So, alternatively, generate a manual, a manual script or form, maybe like professional, like, yeah, for data recording so that he can also record what he does there, the process like. Yeah, I mean, so you can now auto-fill the rest, but before you generate... Give me exactly the thing that I mean. I mean, give me a comprehensive prompt that I can share with other LLMs so that I can generate the best thing. But for now, give me my whole idea separately and also give me the prompts that can be used to create a site like that. You have to note that this is web coding, so give me something authentic.
